## Predictive Parsing

- Like recursive-descent but parser can “predict” which production to use
  - By looking at the next few tokens
  - No backtracking
- Predictive parsers accept LL(k) grammars

lookahead  
restricted grammars

left-to-right  $\swarrow$   $\searrow$  k tokens lookahead  
left-most derivation  $\downarrow$  (k=1)

- In recursive descent,
  - At each step, many choices of production to use
  - Backtracking used to undo bad choices
- In LL(1),
  - At each step, only one choice of production

$w \neq \beta$       next input  $\neq$   
one  $A \rightarrow \alpha$       on input  $\neq$   
 $w \alpha \beta$

- Recall the grammar

$$\begin{aligned} E &\rightarrow \underline{T} + E \mid \underline{T} \\ T &\rightarrow \underline{\text{int}} \mid \underline{\text{int}} * T \mid ( E ) \end{aligned}$$

- Hard to predict because
  - For **T** two productions start with **int**
  - For **E** it is not clear how to predict
- We need to left-factor the grammar

- Recall the grammar

$$\rightarrow E \rightarrow \underline{T} + E \mid \underline{T}$$

$$\rightarrow T \rightarrow \underline{\text{int}} \mid \underline{\text{int}} \underline{*} T \mid \underline{(E)}$$

$$\left[ \begin{array}{l} E \rightarrow \underline{T} \underline{X} \end{array} \right.$$

$$X \rightarrow \underline{+} \underline{E} \mid \underline{\epsilon}$$

└

$$T \rightarrow \underline{\text{int}} \underline{Y} \mid \underline{(E)}$$

$$Y \rightarrow \underline{*} T \mid \underline{\epsilon}$$

Choose the alternative that correctly left factors “if” statements in the given grammar

# Predictive Parsing

$EXPR \rightarrow$  if BOOL then { EXPR }  
                  | if BOOL then { EXPR } else { EXPR }  
                  | ...  
 $BOOL \rightarrow$  true | false

☐  $EXPR \rightarrow$  if true then { EXPR }  
                  | if false then { EXPR }  
                  | if true then { EXPR } else { EXPR }  
                  | if false then { EXPR } else { EXPR }  
                  | ...

☐  $EXPR \rightarrow$  EXPR' | EXPR' else { EXPR }  
 $EXPR' \rightarrow$  if BOOL then { EXPR }  
                  | ...  
 $BOOL \rightarrow$  true | false

☐  $EXPR \rightarrow$  if BOOL EXPR'  
                  | ...  
 $EXPR' \rightarrow$  then { EXPR }  
                  | then { EXPR } else { EXPR }  
 $BOOL \rightarrow$  true | false

☐  $EXPR \rightarrow$  if BOOL then { EXPR } EXPR'  
                  | ...  
 $EXPR' \rightarrow$  else { EXPR } |  $\epsilon$   
 $BOOL \rightarrow$  true | false

- Left-factored grammar

$$E \rightarrow T X$$

$$T \rightarrow ( E ) \mid \text{int } Y$$

$$X \rightarrow + E \mid \varepsilon$$

$$Y \rightarrow * T \mid \varepsilon$$

- The LL(1) parsing table:

	int	*	+	(	)	\$
E	$T X$			$T X$		
X			$+ E$		$\varepsilon$	$\varepsilon$
T	$\text{int } Y$			$( E )$		
Y		$* T$	$\varepsilon$		$\varepsilon$	$\varepsilon$

*next input token*

*leftmost non-terminal*

*rhs of production to use*

- Consider the  $[E, \text{int}]$  entry
  - “When current non-terminal is  $E$  and next input is  $\text{int}$ , use production  $E \rightarrow TX$ ”

	<u>int</u>	*	+	(	)	\$
<u>E</u>	<u>TX</u>			TX		
X			+ E		$\epsilon$	$\epsilon$
T	int Y			( E )		
Y		* T	$\epsilon$		$\epsilon$	$\epsilon$

- Consider the  $[Y, +]$  entry
  - “When current non-terminal is  $Y$  and current token is  $+$ , get rid of  $Y$ ”
  - $Y$  can be followed by  $+$  only if  $Y \rightarrow \epsilon$

	int	*	<u>+</u>	(	)	\$
E	$TX$			$TX$		
X			$+E$		$\epsilon$	$\epsilon$
T	$\text{int } Y$			$(E)$		
<u>Y</u>		$*T$	<u><math>\epsilon</math></u>		$\epsilon$	$\epsilon$

$Y \rightarrow \epsilon$

- Consider the  $[E, *]$  entry
  - “There is no way to derive a string starting with  $*$  from non-terminal  $E$ ”

	int	*	+	(	)	\$
E	TX			TX		
X			+ E		$\epsilon$	$\epsilon$
T	int Y			( E )		
Y		* T	$\epsilon$		$\epsilon$	$\epsilon$

- Method similar to recursive descent, except
  - For the leftmost non-terminal S
  - We look at the next input token a
  - And choose the production shown at [S,a]
- A stack records frontier of parse tree
  - Non-terminals that have yet to be expanded
  - Terminals that have yet to be matched against the input
  - Top of stack = leftmost pending terminal or non-terminal
- Reject on reaching error state
- Accept on end of input & empty stack

```
initialize stack = <S $> and next
                        end of input
repeat
  case stack of
    <X, rest> : if T[X, *next] = Y1...Yn
                  then stack ← <Y1... Yn rest>;
                  else error ();
    <t, rest>  : if t == *next ++
                  then stack ← <rest>;
                  else error ();
  until stack == <>
```

# Predictive Parsing

Stack	Input	Action
<u>E</u> \$	<u>int</u> * <u>int</u> \$	<u>T</u> X
<u>T</u> X \$	<u>int</u> * <u>int</u> \$	<u>int</u> Y
<u>int</u> <u>Y</u> <u>X</u> \$	<u>int</u> * <u>int</u> \$	terminal
<u>Y</u> X \$	<u>*</u> <u>int</u> \$	<u>*</u> T
<u>*</u> <u>T</u> <u>X</u> \$	<u>*</u> <u>int</u> \$	terminal
<u>T</u> X \$	<u>int</u> \$	<u>int</u> Y
<u>int</u> <u>Y</u> <u>X</u> \$	<u>int</u> \$	terminal
<u>Y</u> X \$	\$	<u>ε</u>
<u>X</u> \$	\$	<u>ε</u>
<u>\$</u>	<u>\$</u>	<u>ACCEPT</u>

Choose the next parse state given the grammar, parse table, and current state below. The initial string is:

# Predictive Parsing

if true then { true } else { if false then { false } } \$

	if	then	else	{	}	true	false	\$
E	if B then { E } E'				$\epsilon$	B	B	$\epsilon$
E'			else { E }		$\epsilon$			$\epsilon$
B						true	false
