Ambiguity

- Grammar

$$E \rightarrow E + E \mid E * E \mid (E) \mid id$$

- String

id * id + id

Ambiguity

This string has two parse trees

$E \rightarrow$
 $E * E \rightarrow$
 $E * E + E$
 \rightarrow
 $id * id + id$

- A grammar is *ambiguous* if it has more than one parse tree for some string
 - Equivalently, there is more than one right-most or left-most derivation for some string
- Ambiguity is **BAD**
 - Leaves meaning of some programs ill-defined

Which of the following grammars are ambiguous?

☐ $S \rightarrow SS \mid a \mid b$

☐ $E \rightarrow E + E \mid id$

☐ $S \rightarrow Sa \mid Sb$

☐ $E \rightarrow E' \mid E' + E$

$E' \rightarrow -E' \mid id \mid (E)$

Ambiguity

- There are several ways to handle ambiguity $id * \underline{id} + \underline{id}$

- Most direct method is to rewrite grammar unambiguously

$$\begin{cases} E \rightarrow E' \pm E \mid E' \\ E' \rightarrow \underline{id} * E' \mid \underline{id} \mid (E) * E' \mid (E) \end{cases}$$

- Enforces precedence of $*$ over $+$

$$\begin{aligned} E &\rightarrow E' \pm E \rightarrow E' \pm E' \pm E \rightarrow E' \pm E' \pm E' \pm E \rightarrow \dots \rightarrow E' \pm \dots \pm E' \\ E' &\rightarrow \underline{id} * E' \rightarrow \underline{id} * \underline{id} * E' \rightarrow \underline{id} * \underline{id} * \underline{id} * E' \rightarrow \dots \rightarrow \underline{id} * \dots * \underline{id} \\ &\quad (E) \quad (E) \quad (E) \quad \dots \quad (E) \quad (E) \end{aligned}$$

Ambiguity

$id * id + id$

- Consider the grammar

$E \rightarrow \underline{\text{if } E \text{ then } E}$

$\mid \underline{\text{if } E \text{ then } E \text{ else } E}$

$\mid \underline{\text{OTHER}}$

- The expression

if E_1 then if E_2 then E_3 else E_4

has two parse trees

- **else** matches the closest unmatched **then**

$E \rightarrow$ MIF /* all **then** are matched */
 | UIF /* some **then** is unmatched */

MIF \rightarrow if E then MIF else MIF
 | OTHER

UIF \rightarrow if E then E
 | if E then MIF else UIF

Ambiguity

- The expression $\text{if } E_1 \text{ then if } E_2 \text{ then } E_3 \text{ else } E_4$

Choose the unambiguous version
of the given ambiguous grammar: $S \rightarrow SS \mid a \mid b$

☐ $S \rightarrow Sa \mid Sb \mid \varepsilon$

☐ $S \rightarrow SS'$
 $S' \rightarrow a \mid b$

☐ $S \rightarrow S \mid S'$
 $S' \rightarrow a \mid b$

☐ $S \rightarrow Sa \mid Sb$

- Impossible to convert automatically an ambiguous grammar to an unambiguous one
- Used with care, ambiguity can simplify the grammar
 - Sometimes allows more natural definitions
 - We need disambiguation mechanisms

- Instead of rewriting the grammar
 - Use the more natural (ambiguous) grammar
 - Along with disambiguating declarations
- Most tools allow precedence and associativity declarations to disambiguate grammars

Ambiguity

- Consider the grammar $E \rightarrow E + E \mid \text{int}$
- Ambiguous: two parse trees of $\text{int} + \text{int} + \text{int}$

- Left associativity declaration: $\%left +$
bison

Ambiguity

- Consider the grammar $E \rightarrow E + E \mid E * E \mid \text{int}$
 - And the string $\text{int} + \text{int} * \text{int}$

- Precedence declarations: $\left[\begin{array}{l} \%left + \\ \%left * \end{array} \right]$
